

How to install and run MIPMap as a desktop application:

Requirements:

Operating System: Windows 7 (or newer) 64-bit, Linux, Mac OS

RAM: 4GB or higher

Java version: 8.0

1. Depending on your operating system, run the appropriate installer and choose the directory where the application will be installed.
2. Download and install a last release of PostgreSQL (version 9.2 +)
3. In the folder <Installation_path>/mipmap there is a properties file (postgresdb.properties) containing the necessary information for connecting to the local Postgres database. Provide your credentials.
4. Running *MIPMap.exe* starts the application.

Troubleshooting – Useful Information:

- To run the application manually, the application executable files are located in <Installation_path>/bin.
- Changing the application's JVM properties (like maximum memory size) can be done by altering the configuration file 'mipmap.conf' in the path <Installation_path>/etc
